# Pressures in the system

reflex+ experts No.

## B20

Valid for diaphragm pressure expansion vessels in drinking warm water systems

### Diaphragm expansion vessel

#### Refix

–  $p_{sv}$  Safety valve actuating pressure

The max. permissible operating overpressure of all components in the system must not be exceeded.

–  $p_{fin}$  Final pressure

Pressure in the storage tank after full heating.

–  $p_{ini}$  Initial pressure

Set value pressure reducer, min. flow pressure

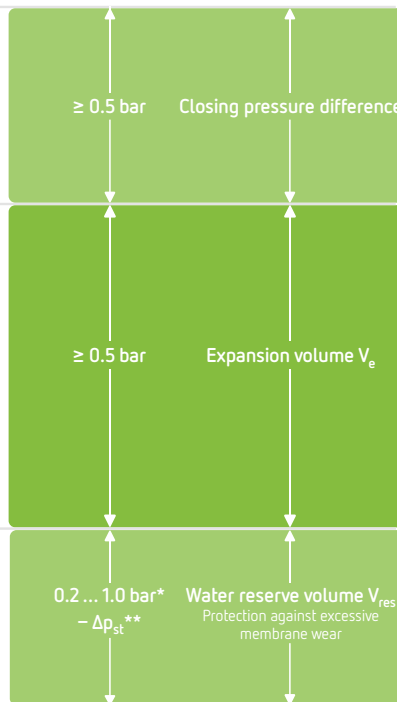

–  $p_0$  Minimum operating pressure

$$= p_{ini} - 0.2 \text{ bar}^* - \Delta p_{st}^{**}$$

\* for large distances (pressure loss) to the pressure reducer, increase the differential to 1 bar

\*\*  $-\Delta p_{st}$  = stat. pressure loss with higher vessel to pressure reducer

+  $\Delta p_{st}$  = stat. pressure gain with lower vessel to the pressure reducer

## B21

Valid for diaphragm pressure expansion vessels in pressure boosting systems

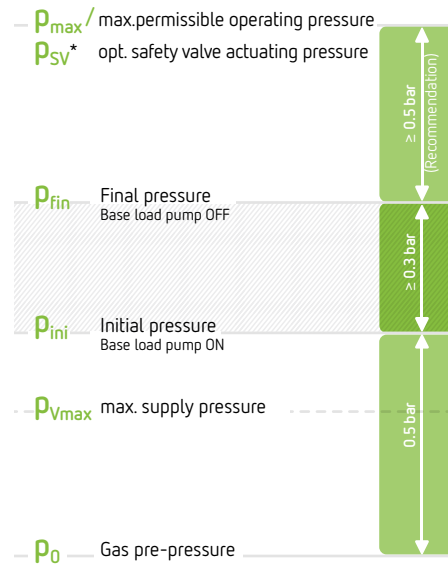

Basics

### Refix in pressure boosting systems

pressure side

$$p_0 \text{ (bar)} = p_{ini} - 0.5 \text{ bar}$$

\* Safety valve only required if  $P_{Vmax} + \Delta P_{Pump} > P_{max}$

Function

Operation & Maintenance

### Refix in pressure boosting systems

suction side

$$p_0 \text{ (bar)} = p_{ini} - 0.5 \text{ bar}$$

\* Safety valve only required if temporarily  $p_{fin} > P_{max}$
